

Learning Objectives

Learners will be able to:

- Properly escalate a ticket to an internal or external escalation group.
- Gather all relevant information for ticket documentation and appropriately title an escalated ticket.
- Handle a callback from a customer regarding an escalated ticket.

It is not unusual for incidents received by the Frontline to require escalation. If an incident cannot be resolved at the Frontline level and requires escalation to another support group, specific information **must** be gathered and documented in the incident **before** that escalation can take place.

There are two (2) types of escalation that can occur with an incident, **Internal** and **External**. These escalations occur when specifically directed by a Knowledge Base Article (KBA), or at the direction of support resource.

- An **Internal** escalation is when an incident is assigned to a Service Desk escalation support queue. This queue is monitored by support resources and is **only** utilized by Frontline technicians when instructed to escalate an incident to the queue **by a support resource (TA/Squad Lead)**.
- An **External** escalation is when an incident is assigned to any other support group outside of the Service Desk. This can include Voice Infrastructure Operations, Collaboration Operations, and other support groups.
 - Some KBAs will reference **End User Computing (EUC) T2** as the escalation group, others may reference **Client T2 EUC**, but they are the same support group.

If an internal versus external escalation cannot be immediately determined, contact support resources for clarification. If unable to find knowledge related to an external group's specific escalation process, or when a process is not defined by the KBA you are following for the issue, engage your support resources.

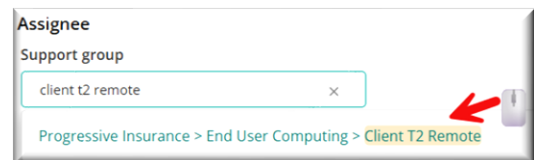

NOTE: Make sure all required troubleshooting has been performed before proceeding through any incident escalation.

Escalating to other support groups in SMART IT

1. Use the **Support group** field under **Assignee** to start typing the support group name.

2. Once the support group pops up, click on the support group name to select it.

3. Once selected, click **Save** to assign the incident to that support group.

In addition to the **EUC T2** support group, the Frontline can also escalate to other support groups (e.g., Mainframe T2, Systems and Infrastructure T2, Wireless T2, etc.). Search for the required support group using the same method described above and select the appropriate group.

Remember to leave the KBAs you followed during troubleshooting pinned to your incident, so the upper-level support groups know which knowledge you were following to troubleshoot the issue for the customer.

NOTE: Escalations to external support groups are specifically determined by KBA or directed by support resources.

EUC T2 Expedited Service Process

Some roles at Progressive qualify for an expedited service process that includes contacting support resources, then having them engage EUC T2 directly to reach back out to the customer within a 15-minute timeframe.

Due to the urgent nature of their role, these customers require immediate upper-level support to address their issues if Frontline is unable to resolve so they can return to work as quickly as possible.

For the complete list of job titles that qualify for the expedited service process, please see [KBA00016767: Engaging End User Computing Product Stacks](#).

NOTE: All appropriate KBAs should be followed, all troubleshooting steps performed, and incident documented prior to engaging support to initiate the process. This process is only available M – F from 8am – 7pm EST. Outside of these hours, assign incident to the EUC T2 support group.

Qualifying Job Title	Non-Qualifying Job Title	VIP
1. Ask customer if callback is needed. If customer is not available or declines, troubleshoot/escalate the incident and leave an activity log stating the warm transfer was declined. If the customer accepts the warm transfer, proceed to step 2. 2. In the activity log, identify the problem and troubleshooting steps performed. Save and confirm ticket before proceeding. 3. Once prepared, contact support resources. They will provide further steps for troubleshooting, or they will engage EUC T2 to complete the warm transfer process.	1. Assign the incident to the EUC Ops group.	1. In the incident's activity log, clearly identify the nature of the problem and all troubleshooting steps performed. Ensure incident is saved and relevant information has been documented before proceeding. 2. Once the incident is prepared, contact support resources. They will provide further steps for troubleshooting if applicable. If not, they will contact the Executive Support EUC Ops group to complete the warm transfer process.

Title Summary Requirements

When an incident is escalated, the title field **must** contain specific details. Review [Job Aid - Title Summary Requirements](#) carefully for a detailed breakdown of an escalated incident's title requirements.

Description Field Requirements

Incidents escalated to another support group **must** contain the following details in the incident's description field:

- Callback phone number.
- Employee ID.
- Machine name.
 - Physical and/or Virtual when necessary for troubleshooting the customer's impacted application. If working in dual environments (physical/virtual machine), document both.

- If the customer's issue is not experienced on their machine(s) and would be irrelevant to troubleshooting, you do not need to document the machine name(s).
 - There are some scenarios where gathering a machine name may not apply. When in doubt, document machine name(s).
- Location details.
 - Campus/Building/Floor/Cubicle details if customer is based at a main office; City/State if customer is a remote user.
- Customer's work schedule.
- Indicate if user is HBA, Offshore Developer, AFNI, Foundever, Teleperformance or TTec.
- Any other relevant information to the incident.
 - For example: model number(s), serial number(s), print server details, printer name(s), etc.
- If working chat, the customer chat session properties from NetAgent.

NOTE: Refer to the [Data Classification and Handling Chart](#) for information on what is authorized to be added here.

Status Updates

If a customer reaches back on the status of an open incident assigned to an external support group:

- Do **not** reassign the incident or change the incident status.
- Create an activity log entry with any new information, such as the customer inquiry or any further troubleshooting that was completed.
- Attempt to contact the assigned technician via Teams, Outlook, or by phone.
- Do **not** rely on the Remedy email to inform the assigned technician of the customer inquiry.

If a customer reaches back because they have not heard from the assigned technician within the incident SLA window:

- Check the incident's activity logs for any work or status entries left by the assigned technician. Do **not** reassign incident or change incident status.
- If there are no work or status entries, update activity log and contact support resources, who will use the **SD+EUC Chat** in Teams to notify EUC Operations that there is a ticket that needs to be assigned.
 - This information can be found using in [KBA00016767: Engaging End User Computing Product Stacks](#).
 - You will **not** provide this information to the customer.
- If you determine the incident has been escalated to the wrong support group, engage your support resources, who will confirm the escalation assignment and how best to proceed. If a transfer of the incident is required, they will engage contacts in the appropriate support group.

If a customer reaches back on an incident that has been assigned to another support group **and** Frontline is able to resolve the open incident with further troubleshooting:

- The SD technician **must** document resolution in the activity log of incident.
- Contact the assigned technician by Teams with the incident number and status of the incident.
- If incident has **not** been assigned to a technician, you can assign the ticket to yourself and resolve. Do **not** reassign incident or change incident status.

If a customer reaches back on an incident in a **Closed** status:

- Do **not** reopen any incident in a **Closed** status.
- Create a new incident and check the customer's incident history for recurring issues or reopened incidents with the same issue.
- If the customer has multiple tickets for the same issue, list at least **two of the previous ticket numbers** in the Activity Log and enter **Ongoing Issue** at the top of the Description field of your new incident.
